Natural Avalanche in the Taylor Fork

Date Wed, 03/01/2023 - 21:00 Activity Snowmobiling

There was about 15" of storm snow. One of the slopes in Sage Basin avalanched with a large <u>cornice trigger</u>. The <u>slide</u> failed 85 cm deep (~3 feet) on a layer of <u>surface hoar</u>. The <u>surface hoar</u> was a surprise as we haven't seen avalanches on this layer for a long time. I got an ECTP27 in the flank, and it failed on the same layer of <u>surface hoar</u> as the avalanche. I would recommend minimizing time on wind-loaded slopes or avoiding them all together. Weak layers buried 3-4 feet deep are back in play, and I wouldn't ride a steep slope without testing them quickly.

Region Southern Madison Location (from list) Taylor Fork Observer Name Dave Zinn
